36	B	51	<p>Nitronium ion formed by: <math>\text{HNO}_3 + \text{H}_2\text{SO}_4 \rightarrow \text{NO}_2^+ + \text{H}_3\text{O}^+ + 2\text{HSO}_4^-</math></p> <p>The diagram illustrates the mechanism of electrophilic aromatic substitution. It starts with a benzene ring (labeled 'benzene') reacting with concentrated <math>\text{HNO}_3</math> and <math>\text{H}_2\text{SO}_4</math>. This produces a nitronium ion (<math>\text{NO}_2^+</math>, labeled 'nitronium ion') and a nitrobenzenonium intermediate ion. The intermediate ion is a six-membered ring with a circle inside, a positive charge on one carbon, and an <math>\text{NO}_2</math> group on the adjacent carbon. A curved arrow shows the movement of electrons from the ring to the <math>\text{H}</math> atom on the <math>\text{NO}_2</math> group, and another arrow shows the <math>\text{H}</math> atom moving to the carbon with the positive charge. The final product is nitrobenzene.</p>

# 2011 Adv Higher Chemistry Marking Scheme

Long Qu	Answer	Reasoning												
1a	Superconductor	Superconductors are materials with zero resistance at low temperatures.												
1b	Liquid Nitrogen	Nitrogen has a boiling point of $-210^{\circ}\text{C}$ (63K) and liquid nitrogen will keep the temperature of the superconductor below the 85K necessary for the material to become a superconductor. There are safety considerations using liquid oxygen and liquid helium is too expensive to use economically.												
2a	Line at $4.6 \times 10^{14}\text{Hz}$	$\lambda = \frac{c}{f} = \frac{3 \times 10^8 \text{ m s}^{-1}}{4.6 \times 10^{14} \text{ s}^{-1}} = 6.52 \times 10^{-7} \text{ m} = 652 \times 10^{-9} \text{ m} = 652 \text{ nm}$ The blue/violet end of the visible spectrum is around 450nm. The red end of the visible spectrum is around 700nm.												
2b(i)	$\text{H(g)} \rightarrow \text{H}^{\text{+}}(\text{g}) + \text{e}^{-}$	1 <sup>st</sup> Ionisation Energy: The energy change for the removal of 1 mol of electrons from 1 mol of atoms in the gaseous state.												
2b(ii)	91nm or $9.13 \times 10^{-8}\text{m}$	$E = \frac{L \times h \times c}{\lambda} \therefore \lambda = \frac{L \times h \times c}{E} = \frac{6.02 \times 10^{23} \text{ mol}^{-1} \times 6.63 \times 10^{-34} \text{ J s} \times 3 \times 10^8 \text{ m s}^{-1}}{1311 \times 1000 \text{ J mol}^{-1}}$ $= 9.13 \times 10^{-8} \text{ m}$ $= 91.3 \text{ nm}$												
3a	NO: +2 NO <sub>2</sub> : +4	<table border="1"> <thead> <tr> <th>Compound</th> <th>No of O atoms</th> <th>Charge from O atoms</th> <th>Oxidation State of Nitrogen</th> </tr> </thead> <tbody> <tr> <td>NO</td> <td>1</td> <td>1 x -2 = -2</td> <td>+2</td> </tr> <tr> <td>NO<sub>2</sub></td> <td>2</td> <td>2 x -2 = -4</td> <td>+4</td> </tr> </tbody> </table>	Compound	No of O atoms	Charge from O atoms	Oxidation State of Nitrogen	NO	1	1 x -2 = -2	+2	NO <sub>2</sub>	2	2 x -2 = -4	+4
Compound	No of O atoms	Charge from O atoms	Oxidation State of Nitrogen
