Past Papers Advanced Higher Chemistry

2020 Marking Scheme

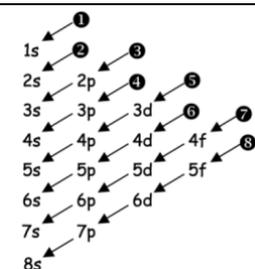

| Grade Obtained | A | B | C | D | N/A |
|----------------|-------|-------|-------|------|------|
| 2020 | 42.9% | 28.4% | 21.5% | 5.3% | 2.0% |
| 2021 | 45.3% | 24.1% | 16.6% | 7.5% | 6.3% |

This marking scheme is for the intended Advanced Higher Chemistry Exam in 2020 which was cancelled due to the Covid-19 pandemic. This paper was widely used in schools in 2021 to predict grades for students when the 2021 exams were cancelled. Some refer to this paper as the 2021 paper for this reason.

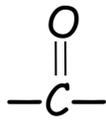

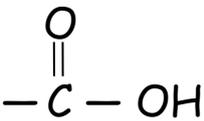

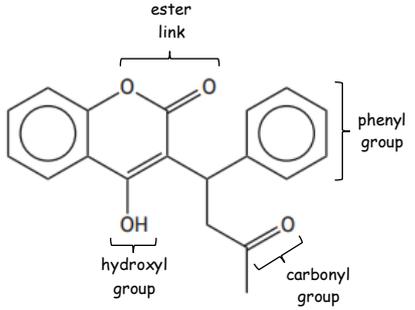

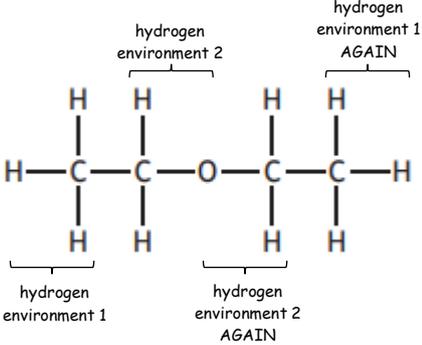

Whether this paper would have been the exact same paper presented to students had the exams gone ahead in 2020 is unknown but it fair to conclude that it would have been very close if not the same.

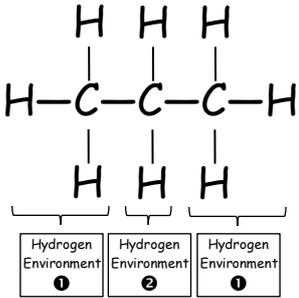

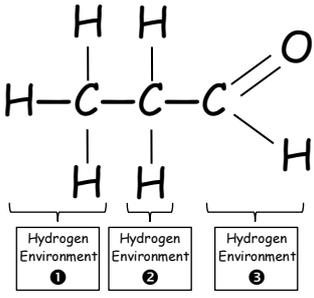

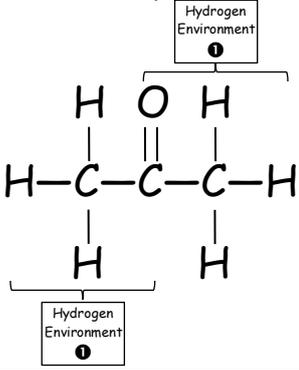

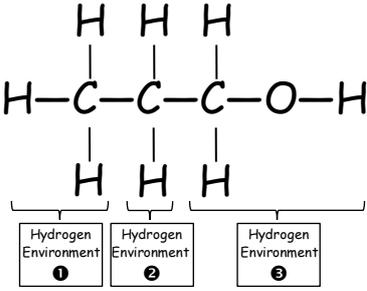

The grades awarded by SQA in 2020 and 2021 are in the table above.

2020 Adv Higher Chemistry Marking Scheme

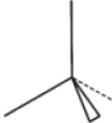

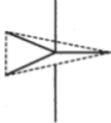

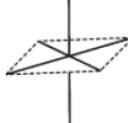

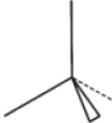

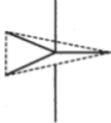

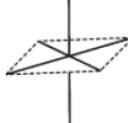

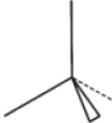

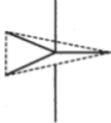

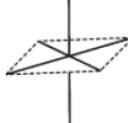

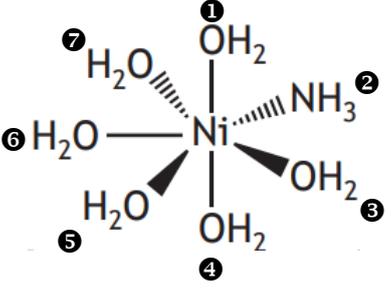

| MC Qu | Answer | Reasoning | | | | | | | | | | | | | | | | |
|------------|----------------------|--|-------------------|--------|----------------|-------------------|-----|----------------------|------------|---------------|-----|-------------------|------------|------------|-----|------------------|------------|-----------|
| 1 | C | <p><u>Aufbau Principle:</u></p> <p>Electrons fill up in order of increasing energy $1s\ 2s\ 2p\ 3s\ 3p\ 4s\ 3d\ 4p\ 5s\ 4d\ 5p\ 6s\ 4f\ 5d\ 6p\ 7s\ 5f\ 6d\ 7p\ 8s$</p>  | | | | | | | | | | | | | | | | |
| 2 | A | <p><input checked="" type="checkbox"/> A $l=0$ ∴ s-subshell and not an outer electron in 2p</p> <p><input checked="" type="checkbox"/> B $l=1$ ∴ p-subshell and an outer electron in 2p</p> <p><input checked="" type="checkbox"/> C $m_l=0$ ∴ named p-subshell in 2p</p> <p><input checked="" type="checkbox"/> D $m_l=1$ ∴ named p-subshell in 2p</p> <p style="text-align: right;"><u>Oxygen</u> electron arrangement = 2,6 electronic configuration = $1s^2\ 2s^2\ 2p^4$</p> | | | | | | | | | | | | | | | | |

| 1a | Electrons drop to lower energy level | Energy is released when a firework explodes and some of the energy is absorbed in promoting electrons to a higher energy level. When those excited electrons fall back to the lower level, specific quantities of energy are released corresponding to the differences in energy levels. These specific quantities of energy correspond to specific wavelengths of light. | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 1b(i) | 620 | $E = \frac{L \times h \times c}{\lambda} \quad \therefore \lambda = \frac{L \times h \times c}{E}$ $\lambda = \frac{L \times h \times c}{E} = \frac{6.02 \times 10^{23} \text{ mol}^{-1} \times 6.63 \times 10^{-34} \text{ J s} \times 3 \times 10^8 \text{ m s}^{-1}}{193 \times 1000 \text{ J}}$ $= 6.20 \times 10^{-7} \text{ m}$ $= 620 \times 10^{-9} \text{ m}$ $= 620 \text{ nm}$ | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

| 2d(i) | Second | <p>$[Ni(OH_2)_6]^{2+}$ has 1st order kinetics as index on square brackets has value = 1 NH_3 has 1st order kinetics as index on square brackets has value = 1 Overall order = order of $[Ni(OH_2)_6]^{2+}$ + order of $[NH_3]$ = 1 + 1 = 2</p> | | | | |
| 2d(ii) | $5200 \text{ l mol}^{-1} \text{ s}^{-1}$ | $k = \frac{\text{rate}}{[Ni(OH_2)_6]^{2+}[NH_3]} = \frac{1.3 \times 10^2 \text{ mol l}^{-1} \text{ s}^{-1}}{0.10 \text{ mol l}^{-1} \times 0.25 \text{ mol l}^{-1}} = 5200 \text{ l mol}^{-1} \text{ s}^{-1}$ | | | | |
| 3a(i) | sp^2 | Benzene has a ring of 6 carbons joined by sigma σ bonded sp^2 hybridised orbitals. Each carbon in the ring has an unhybridised p-orbital which side on merges into rings of delocalised electrons above and below the ring of carbons. (π bonds) | | | | |
| 3a(ii) | side on overlap of orbitals | <p>π bonds are formed from the side on overlap of unhybridised p orbitals perpendicular to the axis of the covalent bond. Sigma bonds are formed by end-on overlap of orbitals along the axis of the bond</p> | | | | |
| 3a(iii) | Answer to include: | 1 st Mark One from: | Short conjugated system | few atoms in the conjugated system | delocalised electrons over a small number of carbon atoms | molecular orbital over a small number of carbon atoms |
| | | 2 nd Mark One from: | A large amount of energy is required to promote an electron from HOMO to LUMO | | Large energy gap between HOMO and LUMO | the energy gap between HOMO and LUMO is not small enough to absorb visible light |
| 3b(i) | (electrophilic) substitution | Substitution reaction as one group joins the ring as another leaves. Electrophilic as the benzene ring is an electron dense molecule and electrophiles will attack the benzene ring. | | | | |
| 3b(ii) | C_9H_{12} | | | | | |
| 3b(iii) | More stable carbocation formed | Re-arrangement of unstable arrangements into more stable arrangements is quite common in chemistry. | | | | |
| 4a | Calcium carbonate/ limestone is insoluble | <p>The calcium carbonate in limestone is insoluble and the reaction between limestone and hydrochloric acid is slow. A direct titration would not give accurate results so a back titration is used. The limestone is left to react with a known excess hydrochloric acid until the reaction is finished and no limestone is left. The hydrochloric acid left over is then calculated by titration with sodium hydroxide and subtracted from the total hydrochloric acid to work out the no of moles of hydrochloric acid which reacted with the limestone.</p> | | | | |
| 4b(i) | 0.0253 | <p>Total no. of mol of HCl = volume x concentration = $0.025 \text{ litres} \times 1.50 \text{ mol l}^{-1} = 0.0375 \text{ mol}$</p> <p>Average volume NaOH = $\frac{10.1 + 10.2}{2} = 10.15 \text{ cm}^3$ (ignoring rogue result 10.7)</p> <p>no. of mol NaOH = volume x concentration = $0.01015 \text{ litres} \times 0.300 \text{ mol l}^{-1} = 0.003045 \text{ mol}$</p> <p style="text-align: center;"> $HCl + NaOH \longrightarrow NaCl + H_2O$ 1mol 1mol 0.003045mol 0.003045mol </p> <p>25cm³ sample reacted with 0.003045mol HCl 100cm³ total flask reacted with 0.01218mol HCl No. of moles reacted with limestone = total no. of mol - leftover HCl = 0.0375 mol - 0.01218 mol = 0.02532 mol</p> | | | | |

| 4b(ii) | 97.4% and yes | $\text{CaCO}_3 + 2\text{HCl} \longrightarrow \text{CaCl}_2 + \text{H}_2\text{O} + \text{CO}_2$ $\begin{array}{ccc} 1\text{mol} & 2\text{mol} & \\ 0.01266\text{mol} & 0.02532\text{mol} & \end{array}$ $\text{gfm CaCO}_3 = (1 \times 40.1) + (1 \times 12) + (3 \times 16) = 40.1 + 12 + 48 = 100.1\text{g}$ $\text{mass} = \text{no. of mol} \times \text{gfm} = 0.01266\text{mol} \times 100.1\text{g mol}^{-1} = 1.266\text{g}$ $\% \text{ purity} = \frac{\text{Mass of pure calcium carbonate}}{\text{Mass of limestone}} \times 100 = \frac{1.266\text{g}}{1.30\text{g}} \times 100 = 97.4\%$ Purity is greater than 95% so limestone can be used. | | | | | | | | | | | | | | | | | | | | |

| 9a | Substance which alters the biochemical processes in the body | A drug is a chemical which alters the normal biochemical processes in the body. An agonist is a chemical which binds to a receptor protein and produced the biochemical response. An antagonist is a chemical which binds to a receptor but does not produce the biochemical response. | | | | | | | | | | | | | | | | | | | | | | |
|---|---|---|--|--|---------------|---------------|---------------|---|---|--|--|------|--|------|----------|--|----------|--|----------|-----------|--|-----------|--|----------|
| 9b | inhibitor | Inhibitors bind to proteins in body to block their activity. Antagonists bind to receptor proteins to block the biochemical response of receptor | | | | | | | | | | | | | | | | | | | | | | |
| 9c | 2483 | $1\text{kg bodyweight} \quad \longleftrightarrow \quad 0.68\text{mg}$ $8.4\text{kg bodyweight} \quad \longleftrightarrow \quad 0.68\text{mg} \times 8.4/1 = 5.712\text{mg}$ $2.3\text{cm}^3 \text{ dose} \quad \longleftrightarrow \quad 5.712\text{mg}$ $1000\text{cm}^3 \text{ dose} \quad \longleftrightarrow \quad 5.712\text{mg} \times 1000/2.3 = 2483\text{mg}$ $\therefore 2483 \text{ mg per litre} = 2483\text{ppm}$ | | | | | | | | | | | | | | | | | | | | | | |

| 11b | Answer to include: | One from list for 1 st Mark | Structure depends on VSEPR/ minimising repulsion/minimising repulsion between lone/non-bonding pairs | | | | | | | | | | | | | | | | | | | | | |
| | | One from list for 2 nd Mark | (In B) the lone/non-bonding pairs are 120° from one another | in A the lone/non-bonding pairs are 90° from one another | | | | | | | | | | | | | | | | | | | | |
| | | repulsion is greatest between lone/non-bonding pairs | | the angle is greater between non-bonding/lone pairs (in B) | | | | | | | | | | | | | | | | | | | | |
| | | the lone/non-bonding pairs are further away from each other (in B) | | | | | | | | | | | | | | | | | | | | | | |

| | | | | | | | | | |
|-------------------------------------|---|--|--|--|---|---|---|---|--|
| 12a |  |  | | | | | | | |
| 12b | To prevent reactant/product/vapour from escaping | The vapour created by evaporation of substances in the round bottom flask is condensed in the condenser unit and the chemicals returned to the round bottom flask. The condenser unit has cold water going in at the bottom and water leaving at the top. | | | | | | | |
| 12c | Distillation | Distillation separates substances with different boiling points with the substance with the lower boiling point leaving as a vapour then condensed and collected. In this reaction the ethanol $\text{CH}_3\text{CH}_2\text{OH}$ will evaporate and the sodium benzoate $\text{C}_6\text{H}_5\text{COO}^-\text{Na}^+$ remains dissolved in the flask of the distillation apparatus. | | | | | | | |
| 12d | Elimination | Elimination reactions remove small molecules and leave $\text{C}=\text{C}$ double bonds behind (and sometimes $\text{C}\equiv\text{C}$ triple bonds). Dehydration is the same reaction but the small molecule removed is water. | | | | | | | |
| 12e | Positively charged hydrogen in HBr |  | | | | | | | |
| 12f(i) | Answer to include: | <table border="1"> <tbody> <tr> <td>1st Mark (one required)</td> <td>The (benzoate) ion from the salt removes/reacts with H^+ from the water</td> <td>the conjugate base of the weak acid, removes/reacts with H^+ ions from the water</td> </tr> <tr> <td>2nd Mark (one required)</td> <td>This results in the water equilibrium shifting to the right hand side</td> <td>Shifting to the left hand side if candidate has written an equilibrium reaction with ions on the left hand side</td> <td>this results in excess OH^- ions from the water equilibrium</td> </tr> </tbody> </table> | 1 st Mark (one required) | The (benzoate) ion from the salt removes/reacts with H^+ from the water | the conjugate base of the weak acid, removes/reacts with H^+ ions from the water | 2 nd Mark (one required) | This results in the water equilibrium shifting to the right hand side | Shifting to the left hand side if candidate has written an equilibrium reaction with ions on the left hand side | this results in excess OH^- ions from the water equilibrium |
| 1 st Mark (one required) | The (benzoate) ion from the salt removes/reacts with H^+ from the water | the conjugate base of the weak acid, removes/reacts with H^+ ions from the water | | | | | | | |
| 2 nd Mark (one required) | This results in the water equilibrium shifting to the right hand side | Shifting to the left hand side if candidate has written an equilibrium reaction with ions on the left hand side | this results in excess OH^- ions from the water equilibrium | | | | | | |
| 12f(ii) | Filtration | Insoluble solids are removed from liquids by filtration. Vacuum filtration can be used to speed up the movement of solution through the filter paper. | | | | | | | |
| 12g | Recrystallisation | Recrystallisation is used to increase the purity of a substance because that substance is highly soluble in a solvent at high temperature but less soluble at lower temperature. The substances crashes out of the solution on cooling but the impurities stay dissolved in the solvent. | | | | | | | |
| 12h(i) | Pure benzoic acid | When pure benzoic acid is added to the benzoic acid collected from process Y, the melting point will be unchanged if the benzoic acid collected in process Y is pure. Impurities in the benzoic acid collected in process Y will change the melting point of the mixture if they are present when mixed with pure benzoic acid. | | | | | | | |
| 12h(ii) | Answer to include: | <table border="1"> <tbody> <tr> <td>1st Mark:</td> <td>Any mention of measuring or looking up the melting point of pure benzoic acid</td> </tr> <tr> <td>2nd Mark:</td> <td>Correctly linking the mixed melting point value to the purity</td> </tr> </tbody> </table> | 1 st Mark: | Any mention of measuring or looking up the melting point of pure benzoic acid | 2 nd Mark: | Correctly linking the mixed melting point value to the purity | | | |
| 1 st Mark: | Any mention of measuring or looking up the melting point of pure benzoic acid | | | | | | | | |
| 2 nd Mark: | Correctly linking the mixed melting point value to the purity | | | | | | | | |

12i

1st Mark:
Spectrum C

2nd Mark:
No C=O peak at
1700 cm⁻¹ in spectrum C
or
spectra A and B have
a C=O peak at 1700 cm⁻¹

| Spectrum | | Deductions |
|---|--|--|
| <p>Spectrum A</p>  | | <p>Contains peak 1730-1717cm⁻¹ ∴ C=O stretch in aromatic ester</p> <p>Contains peak 3100-3000cm⁻¹ ∴ Benzene ring</p> <p>Conclusion: Ethyl Benzoate</p> |
| <p>Spectrum B</p>  | | <p>Contains peak around 1700cm⁻¹ ∴ carbonyl C=O peak</p> <p>Contains peak 3000-2500cm⁻¹ ∴ hydrogen bonded -OH group in -COOH group</p> <p>Conclusion: Benzoic Acid</p> |
| <p>Spectrum C</p>  | | <p>Contains peak 3600-3200cm⁻¹ ∴ hydrogen bonded O-H stretch in alcohol</p> <p>No Peak around 1700cm⁻¹ ∴ C=O Carbonyl stretch</p> <p>Conclusion: Ethanol</p> |
